Website review for Gaziantep Metropolitan Municipality

Reviewed by Hayrunnisa İYİKÖŞKER, 10 November 2026

What is working well

- **Safe connection.** When someone enters the old “http” address, the website sends them to the secure version. Its security certificate is valid.
- **Friendly search.** When a search finds nothing, the events page shows a clear message and a button to see all events. The words the visitor typed stay in the search box, so they can easily try again.

The three things to fix first

1. Some visitors get stuck in the news slider

- **What visitors experience:** Some people use the Tab key instead of a mouse (for example because of a disability). When they reach the news slider, they get stuck in it and have trouble reaching the rest of the page.
- **Why it matters:** These visitors cannot really use the website, and a municipal website should work for everyone.
- **Ask your web developer to:** let the Tab key move past the news slider, and add a “skip to main content” link at the top of the page (a link that lets keyboard users jump straight to the main content).
- **How to check it is fixed:** Open the home page and press the Tab key about 30 times. The highlight should move on to other parts of the page and should not stay in the slider.

2. The home page is slow with a weak internet connection

- **What visitors experience:** The home page has two large videos and a large animated image. When I tested a slow connection, I saw only the logo for about 13 seconds. After one minute, many pictures were still missing.
- **Why it matters:** People with a weak signal or little mobile data may wait too long and leave before the page opens. The page also uses a lot of their data.
- **Ask your web developer to:** make the videos and the animated chat image much smaller, not load the background video on mobile phones, and load pictures only when visitors scroll to them.
- **How to check it is fixed:** Open the home page on your phone using mobile data instead of Wi-Fi. The main text and news should appear within a few seconds.

3. Buttons and form fields are not clearly named

- **What visitors experience:** The small eye buttons on the announcements and the chat robot button have no names. A screen reader (software that reads the page aloud for blind visitors) may say only “button”, so they cannot tell what the buttons do. In the facility visit form, clicking a field’s title does not select its box, and visitors cannot see which fields are required until they press submit.
- **Why it matters:** Blind visitors cannot tell what the buttons do, and the form does not say what is needed, which slows everyone down.
- **Ask your web developer to:** give every icon button a clear name, such as “Read the announcement” and “Open live chat”, connect each field title to its box, and mark required fields with a star (*).
- **How to check it is fixed:** Open the facility visit form and click the word “Adı” above the first box. The cursor should jump into the box, and required fields should show a star before you press anything.

Thank you for letting me review your website. I hope these ideas help make it easier to use for every resident.
