Stretch S1: Benchmark against a second site

Prepared by	Hayrunnisa İYİKÖŞKER (2203060011)
Site 1	Gaziantep Büyükşehir Belediyesi, https://www.gaziantep.bel.tr/ (checked 7–8 November 2026)
Site 2	Şahinbey Belediyesi, a district municipality in Gaziantep, https://www.sahinbey.bel.tr/ (checked 9 - 10 November 2026)
Browser	Google Chrome 156.0.8078.80 (64-bit), Windows 11
Method	I repeated six checks (A1, A3, A4, A7, B2, B7) on the second site in the same browser. I did the network checks (A3, A4, B2) with the cache disabled and no throttling. The results for site 1 come from my main report. The time of each screenshot is in the evidence log.

Comparison

Check	Gaziantep BB (site 1)	Şahinbey (site 2)	Better
A1 HTTPS and redirects	The http:// address answered with 301 Moved Permanently and sent the browser to https://www.gaziantep.bel.tr/ (status 200). The certificate is valid (Sectigo, expires 20 February 2027). [A1]	The http:// address answered with 302 Found and Location /index.aspx. The list then shows index.aspx and index before the final page https://www.sahinbey.bel.tr/Default (status 200). I opened only the first request. The certificate is valid (RapidSSL, expires 6 February 2027). [S1-A1]	Gaziantep BB (one 301 straight to https; site 2 uses a 302 and more steps)
A3 One request, closely	52 requests, 12.9 MB transferred (14.5 MB of resources). DOMContentLoaded at 2.87 s, full load at 6.35 s. [A3]	152 requests, 30.3 MB transferred (31.1 MB of resources). DOMContentLoaded at 1 min, full load at 2.6 min. [S1-A3]	Gaziantep BB (fewer requests, less data, faster in my tests)
A4 A page that does not exist	Real 404 status. The page has the logo, “Page Not Found!”, the buttons “Go to homepage” and “Go back”, and shortcut cards. The message is only in English. [A4]	Status 200, so it is a soft 404. The address changed to /sayfayok?aspxerrorpath=... and the page is only the plain text “Sayfa Bulunamıyor.. Anasayfaya dön”, with no logo or menu. The tab title is “Untitled Page”. [S1-A4]	Gaziantep BB (correct status, more helpful page)
A7 SEO basics	Title, meta description, canonical link (https://www.gaziantep.bel.tr/), lang="tr" and one h1 are all present. No sponsored or ugc links. [A7]	Title: “Şahinbey Belediyesi”. The console returned an empty value for the meta description and for lang. No canonical link was found. 0 h1 headings. No sponsored or ugc links. [S1-A7]	Gaziantep BB (all basic items present)
B2 Empty state	On the events page, “zzzqqq” shows an icon, the message “Kayıt bulunamadı” and a “Tüm Etkinlikler” button. The filter shows “Toplam: 0 kayıt” and a “Temizle” button, and my text stays in the box. [B2]	I searched “zzzqqq” in the search box of the map application (kbs.sahinbey.bel.tr/keos/). The panel “Arama Sonuçları” shows “Kayıt bulunamadı.” I did not see a button or a suggestion for the next step. My text stays in the box. [S1-B2]	Gaziantep BB (gives a next step; the two searches are not the same kind)
B7 Accessibility audit (Lighthouse)	Home page 68/100 in Mobile mode. Main problems: buttons without accessible names, images without alt text, form fields without labels, links without discernible names. [B7]	Home page 69/100 in Mobile mode. Lighthouse warned that the page loaded too slowly and the results may be incomplete. The main problems are the same four as on site 1. [S1-B7]	Similar (68 and 69)

I measured the two sites on different days, so the load times may also depend on my connection or on the server at that moment. The screenshots of site 2 are named S1-<id>-site2.png in the evidence folder.

What the first site could learn from the second

The second site has a round accessibility button at the bottom right of its home page (I did not open it), and I did not find one on the first site, so the first site could add one. The second site answers a missing page with status 200 and one line of plain text, with no menu and no logo, so the first site should keep its real 404 page with a way back to the home page. The second site has an empty meta description, an empty page language and no canonical link, so the first site should keep its title, description, canonical link and language in place.
