Usability Test with One Real Person (Stretch S2)

Site tested: https://www.gaziantep.bel.tr/ (Gaziantep Büyükşehir Belediyesi).

Tester: Hayrunnisa İYİKÖŞKER, 2203060011.

Participant and method

- **Participant:** one volunteer (Participant 1), a university student of English Language Teaching, not a computing student. Tomiris Nurpeissova.
- **Method:** I watched the participant use the site and did not help. I used the three tasks and the follow-up questions from the Appendix C script. The participant thought aloud. The session took about 12 minutes.
- **Safety:** the participant did not fill in or send any form.

Tasks and notes

Task	Time taken	Where did they hesitate?	Words used (quoted, or paraphrased where marked)
1. Find a contact number for the municipality (support line)	about 20 seconds	They did not hesitate. They found the number quickly with the shortcut buttons on the screen.	“[it’s] viewable and really easy to find how to connect with them”
2. Find the theatre event page	about 2 seconds	They did not hesitate.	Paraphrased: they liked the theatre event page.
3. Find the facility visit form (the main task for this test)	Not finished; time not recorded	The home page has no search button, so they did not know where the form was. They tried several times at random and then gave up.	Paraphrased: they needed a few random tries to understand where the page was, and said that with a search button they could do it quickly.

Questions after the tasks

- **Most frustrating moment:** not being able to find the page (the facility visit form). (translated from Turkish)
- **What would you change first:** add a search button to the page. (translated from Turkish)

Other comments (paraphrased from my notes)

- **Liked:** easy access to details; the feedback option and the culture and arts page; the sliding menu, because each item stays long enough to see the title and the picture; clear, readable and matching colours; the language options (they suggested adding Russian and Kazakh, maybe French).
- **Did not like:** not all pages have English support; no search button on the home page.
- **Overall:** they said the site is easy to access.

Link to my Core findings

- **Language [A4, B2].** The participant noticed that not every page has English support. My own checks also show uneven language: the 404 page stayed in English after I chose Turkish [A4], but the empty search message was in Turkish [B2]. The problem is a different one (missing English pages, not a wrong language), but both show that language is the least consistent part of the site.
- **News slider [B6].** The participant liked the slider, but I found that it blocks keyboard users [B6]. This does not contradict my finding, because they used a mouse and the problem only affects people who use the Tab key.
- **Slow loading [A3, B1].** The participant did not mention slow loading. I did not record their connection, and I only saw long waits with Chrome’s 3G throttling [B1], so a normal connection may hide the problem.
- **Form [B4, B5].** The participant could not find the facility visit form, so they never met the form problems I found. Visitors must find the form first, before the missing required marks and unconnected labels matter.
- **New finding, not in my Core audit.** As far as I could see, the home page has no search icon, and the participant suggested one after failing task 3. I only checked the filter on the events page [B2], not

a site-wide search. Task 1 also shows a strength: the shortcut buttons helped them find the support line in about 20 seconds.
