Usability Test with One Real Person (Stretch S2)

Site tested: https://www.gaziantep.bel.tr/ (Gaziantep Büyükşehir Belediyesi). Tester: Hayrunnisa İyikösker, 2203060011.

Participant and method

- **Participant:** one volunteer (Participant 1), a university student of English Language Teaching, not a computing student. No name is recorded.
- **Method:** I watched the participant use the site and did not help. I used the three tasks and the follow-up questions of the Appendix C script. The participant thought aloud. The whole session took about 12 minutes.
- **Safety:** the participant did not fill in or send any form.

Tasks and notes

Task	Time taken	Where did they hesitate?	Words used (quoted, or paraphrased where marked)
1. Find a contact number for the municipality (support line)	about 20 seconds	Did not hesitate. The participant reached the number quickly using the shortcut buttons on the screen.	“[it’s] viewable and really easy to find how to connect with them”
2. Find the theatre event page	about 2 seconds	Did not hesitate.	Paraphrased: the participant liked the theatre event page.
3. Find the facility visit form (the site’s main task for this test)	Not finished; time not recorded	The home page has no search button, so they did not know where the form was or how to find it. They made several random attempts and then gave up.	Paraphrased: they needed a few random tries to understand where the page was, and said that with a search button they could do it quickly.

Questions after the tasks

- **Most frustrating moment:** not being able to find the page (the facility visit form). *(translated from Turkish)*
- **What would you change first:** add a search button to the page. *(translated from Turkish)*

Other comments (paraphrased from my notes)

- **Liked:** easy access to details; the feedback option and the culture and arts page; the sliding menu, because each item stays long enough to glance at the title and see the picture; readable, clear and matching colours; the language options (they suggested adding Russian and Kazakh, perhaps French).
- **Did not like:** not all pages have English support; there is no search button on the home page.
- **Overall:** they said the site is easy to access.

Link to my Core findings

- **Language (related to A4 and B2).** The participant noticed that not every page has English support. My own checks also show uneven language handling: the 404 page stayed in English after I chose Turkish [A4], while the empty search message was in Turkish [B2]. The point is different (missing English pages, not a wrong language), but both show that language support is the least consistent part of the site.
- **Sliding menu (does not contradict B6).** The participant liked the news slider. I found that it traps keyboard users [B6]. This is no contradiction: they used a mouse, and the trap only affects people who move with the Tab key. The slider works well for mouse users but not for keyboard users.
- **Slow loading (does not confirm or contradict A3 and B1).** The participant did not mention slow loading. I did not record their connection, and I only saw long waiting times with Chrome’s 3G throttling [B1], so a normal connection may hide the problem.
- **Form (adds a step before B4 and B5).** The participant could not find the facility visit form at all, so they never met the form problems I found [B4], [B5]. This suggests that visitors must first find the form before the missing required marks and unconnected labels matter.

- **New finding, not in my Core audit.** As far as I could see, the home page has no search icon, and the participant suggested adding one after failing task 3. I only checked the search filter on the events page [B2], not a site-wide search. The task 1 result also shows a strength: the shortcut buttons helped the participant to find the support line in about 20 seconds.
